V.	Reas ned statement under Article 35(2) with regard to novelty, inventive step or industrial ap	plicability;
	citations and explanations supporting such statement	

1.	statement			
	Novelty (N)	Claims	10-20	YES
		Claims	1-9	NO
	Inventive Step (IS)	Claims	NONE	YES
	•	Claims	1-20	NO
	Industrial Applicability (IA)	Claims	1-20	YES
		Claims	NONE	NO

2. citations and explanations (Rule 70.7)

Claims 1-9 lack novelty under PCT Article 33(2) as being anticipated by Larsen et al. (US Pat. No. 5,272,07, 12/93).

Larsen et al. teach the use of expression vectors (e.g. lambda phage) for recombinantly incorporating selenocysteine (SeCys) into a peptide as part of a vector surface protein fusion protein (see e.g. col 5, line 63 to col. 6, line 60; col. 7 line 35-45; col. 9 line 35-60; col. 15, line 60 to col. 16 line 8; col. 20, line 40-57; examples; col. 33 line 18-43; col. 35, line 13-line 25; patent claims 3-15.

Claims 1-9 lack novelty under PCT Article 33(2) as being anticipated by Leonard et al. (US Pat. No. 5,700,660, 12/97).

Leonard et al. teach the use of conventionally known recombinant expression vectors (e.g. baculovirus vectors: e.g. see col. 19, lines 5-15) to "transduce" "transform" or "transfect" procaryotic/eucaryotic cells for recombinant incorporation of selenocystein into a peptide e.g. as part of a surface protein fusion protein (e.g. see col. 3, line 24-35; col. 5, lines 25-35; col. 13, lines 42- col. 14, line 58; col. 18-19; patent claims 1-16), with further "nucleophilic substitution" (e.g. see col. 19, lines 24-35) of SeCys being possible for purposes of screening.

Claims 10-20 lack an inventive step under PCT Article 33(3) as being obvious over Dower et al. (US Pat. No. 5,432,018, 7/95) in view of Pegoraro et al. (J. Mol. Biol). Larsen et al. and/or Leonard et al.

Dower et al. disclose the use of phage peptide libraries for screening ligands by binding to receptor (e.g. See Abstract; col. 4; Examples, especially example III; and patent claims).

Dower et al. also teach diversification of phage-produced peptide libraries (col. 6-14) including amino acid modification of the 20 naturally occurring amino acids by "chemical modifications" including carboxy terminal amidation, introduction of enzyme substrate peptide structure, metal (Continued on Supplemental Sheet.)

PCT/US00/13292

Supplemental Box

(To be used when the space in any of the preceding boxes is not sufficient)

Continuation of: Boxes I - VIII

Sheet 10

V. 2. REASONED STATEMENTS - CITATIONS AND EXPLANATIONS (Continued):

coordination complexes (E.g. to cys) and the introduction of conformational constraints using cysteine incorporation and formation (e.g. by oxidation) of disulfide bonds (e.g. see col. 9-12).

The Dower et al. reference fails to teach the use of SeCys in its phage peptide libraries for screening.

However, the Pegoraro et al. reference teaches that substitution of Secys for cys when introducing conformation constraints is desirable due to the "high stability of the desclenide group toward reducing agents (e.g. see abstract).

Thus the Pegoraro et al. reference provides motivation to substitute SeCys for Cys during the "chemical modification" of the Dower et al. libraries to realize the increased stability of SeCys.

Further, one of ordinary skill in the art would further be motivated to incorporate SeCys into the Dower phage display library at the onset in order to increase diversity (e.g. synthesize more potential ligands) by use of 21 instead of the 20 naturally occurring amino acids.

In this regard, the use of conventionally known recombinant expression vectors (e.g. baculovirus vectors) to "transform" or "transfect" procaryotic/eucaryotic cells for recombinant incorporation of selenocystein into a peptide with further "nucleophilic substitution" of SeCys for purposes of screening is known in the art. See e.g. Larsen and Leonard references described above.

Thus, modification of the Dower et al. phage peptide library technique to utilize SeCys would have been obvious to one of ordinary skill in the art in order to increase peptide bond stability and increase peptide diversity.

Claims 1-20 meet the criteria set out in PCT Article 33(4).
NONE
